

AI FINANCE CONTROLLER • TRACK 04

The GST you're losing, recovered before the money moves.

Indian companies quietly lose 18% GST on every employee expense — one receipt in the wrong name at a time.

THE PROBLEM

Two pipelines that never meet

The money pipeline

Knows Priya · hotel · ₹11,800

Speed fast · approved in a day

Blind to whose name the bill is in

The tax pipeline

Needs GSTIN 27... · inv HTL/2026/4471

Cadence monthly · owned by a CA

Deadline GSTR-2B locks the credit

No join key between them → 18% GST leaks, silently.

CreditLoop builds the join: claim → invoice → GSTIN → 2B → payout
→ book

One loop, closed end to end

01 Read the receipt

A vision model (Gemini) pulls GSTIN, invoice no. and tax split off a crumpled photo — and refuses to guess when it can't read one.

02 Judge with the law

A deterministic engine — never an LLM — decides eligibility, citing the exact rule and version. Before payout.

03 Chase • pay • reconcile

Pay on time, draft the vendor fix while it's still possible, then match against GSTR-2B. Full audit trail.

An LLM may never change a tax verdict or move money — it reads, drafts, and proposes; the deterministic engine decides.

Measured on 200 hard claims

100%

2B match rate

100%

engine accuracy

0.06

API calls / claim

₹0

false-block cost

The exception rate is a feature.

27.5% of claims are refused — each with a machine-readable reason. An agent that always decides is an agent that guesses. Nothing fails silently.

Section 17(5) precision / recall: 100% / 100%

Why it's a company, not a demo

Free supervision, forever

Every month the government's 2B statement tells us whether each prediction was right — a labelled signal on every transaction, at no cost.

A moat that compounds

The vendor-reliability we learn stitches across customers. The edge isn't the tax logic — it's the data only we collect by joining the two pipelines.
